To whom it may concern,

I need to know who I can get in touch with. As you know gas companies are drilling for natural gas wells in Penna. They are now using the fracking system. Can you please tell me how the farmers of our area in Bedford County are to blame for the pollution in the Chesapeake Bay but yet we as a state are allowing the big gas companies to pump millions of gallons of poisons in the earth. They need approx. 2 million gallons of water a day to drill. 1 percent of that is chemicals that are polluting the water. They told us that 90% of this water stays in the ground. where is this poison going to come out at? Here in our area wells or our streams. Or maybe it is making its way down to the chesapeake bay area. Please check into where this poison is heading, may this is something that the Bay should be checking into. Hurry and start a study so that our underground water shed is not destroyed.
